AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

LISTING OF CLAIMS

(Currently Amended) A method for use by nodes to route packet traffic through a 1. multiple-hop wireless communications network, the method comprising:

detecting interference with packet-switched communications carried by radio frequency (RF) over the multiple-hop wireless communications network; and

adaptively determining, in response to information related to the detected interference, a route for transmitting packets through the multiple-hop wireless communications network that mitigates the effect of the interference on the packets.

- (Currently Amended) The method of claim 1 further comprising the step of 2. identifying a source of the interference to be a node in the multiple-hop wireless communications network, and wherein the adaptively determined route excludes the node.
- (Currently Amended) The method of claim 1 further comprising the step of 3. identifying one or more nodes interfered with by the interference, and wherein the adaptively determined route excludes one or more of the interfered-with nodes.
- (Currently Amended) The method of claim 1 further comprising the step of 4. approximating a geographical location of a source of the interference, and wherein the adaptively determined route excludes one or more nodes near that location.
- (Original) The method of claim 1 wherein the step of detecting interference 5. includes determining that signals received by a node are of an unauthorized protocol.
- (Original) The method of claim 1 wherein the step of detecting interference 6. includes determining that an address included in signals received by a node is an address of a known unauthorized source.
- (Original) The method of claim 1 wherein the step of detecting interference 7.

Response under 37 C.F.R. § 1,111 Serial No. 10/029,378 Page 3

includes determining that a protocol header included in signals received by a node has invalid information.

- 8. (Original) The method of claim 1 further comprising operating a protocol at a physical layer of a protocol stack that detects the interference.
- (Currently Amended) The method of claim 8 wherein the step of adaptively 9. determining a route is performed by a network layer protocol in the protocol stack in response to a notification from the physical layer protocol of the interference.
- (Original) The method of claim 1 further comprising operating a protocol at a 10. data link layer of a protocol stack that detects the interference.
- (Currently Amended) The method of claim 10 wherein the step of adaptively 11. determining a route is performed by a network layer protocol in the protocol stack in response to a notification from the data layer protocol of the interference.
- (Original) The method of claim 1 further comprising operating a protocol at a 12. network layer of a protocol stack that detects suspicious communication behavior.
- (Original) The method of claim 12 wherein the step of detecting interference is accomplished by a physical layer protocol of the protocol stack in response to a notification from the network layer protocol of the suspicious network behavior.
- (Currently Amended) The method of claim 1 further comprising adaptively 14. adjusting an antenna pattern of a node in the wireless communications network in response to detecting the interference.
- (Currently Amended) The method of claim 14 wherein the step of adaptively 15. adjusting the antenna pattern includes forming a null in the antenna pattern in a direction of the interference.
- (Original) The method of claim 1 further comprising disseminating to nodes in 16. the multiple hop wireless communications network information related to the detecting of the interference.

Response under 37 C.F.R. § 1.111 Serial No. 10/029,378 Page 4

- (Original) The method of claim 16 wherein the disseminated information is an 17. identity associated with a source of the interference.
- (Original) The method of claim 16 wherein the disseminated information is an 18. identity associated with a node in the multiple hop wireless communications network that is being interfered with by the interference.
- (Original) The method of claim 1 identifying a source of the interference to be a 19. node in the multiple-hop wireless communications network, calculating a cost function for a plurality of routes from a sending node to a destination node that exclude the interfering node, and selecting the route with a lowest cost function.
- The method of claim 1 wherein the nodes in the wireless 20. (Original) communications network operate according to one of the protocols selected from the group consisting of IEEE 802.11, BLUETOOTH, HYPERLAN and HOMERF.
- (Original) A protocol stack for use by a node to communicate over a wireless 21. communications network, the protocol stack comprising:
- a radio frequency (RF) physical layer for detecting signals that are attempting to interfere with packet-switched communications at the node, the RF physical layer producing a signal that indicates that interference has been detected; and
- a network layer receiving the signal from the RF physical layer and producing an alternate route of packets through the wireless communications network in response to the signal.
- (Original) The protocol stack of claim 21 further comprising a data link layer for 22. checking for errors packets received by the node and sending a signal to the network layer when interference has been detected.
